

## Data structure

My data class consists of 5 fields :

- **Event Location as a String:** Event location helps get the location(Lagos, Egypt, UK, and Seoul).
- **Event Title as a string:** Even Title helps to get the event Title (AFBA..)
- **Rating as a string:** Rating helps to get the event star rate.
- **Image as an integer:** Image helps to get the EvenLocation Image
- **Liked as a boolean:** Likes helps to get the liked Items
- **ID:** ID to get the unique Id of the event to track the favourite event

I got the list of the data and bind them to my viewholder in my adapter class
